The OM-PL Series data loggers are versatile devices that can be used for a wide range of logging applications. Each data logger is capable of sampling data as fast as once per second or as slow as once every 18 hours. The data logger can stop recording when memory becomes full or rollover for continuous recording. The start of recording is software selectable to be immediate, delayed, or initiated when the data logger door is closed.

The data logger can also be used to monitor high and low alarm events, which indicate if the recorded data passed above and/or below the user-selected threshold. The alarm events are stored separately from the data samples and are not affected by data rollover. When the recorded data passes the high or the low alarm threshold, the data logger records the time of the alarm.

When the recorded data returns to within the acceptable range, the data logger records the duration of the alarm. Up to 50 such alarm events can be recorded. The data logger has a visual indication of an alarm condition without the need to connect to the computer.

All OM-PL Series data loggers have an internal real-time clock/calendar. This real-time clock is used to record the time stamps for data samples and alarm events. It is independent of the computer clock and can be set separately, or set to match the computer clock.

These data loggers provide a high level of data security. They have physical security, when the data access door is locked, as well as software security. It is virtually impossible to falsify sample data or alarm information of OM-PL Series data loggers. Their power requirement is very low: under normal operating conditions, a 9-volt alkaline battery will last 18 months to 2 years.

OM-PL Series data loggers have the capacity to store over 10,000 readings. Simply connect the data logger to your PC's serial port and use the available Windows software to set up parameters for your recording session. Once the data logger is set up, you can disconnect it and put it in the field to record data. The data logger door can be locked on to prevent accidental or intentional disruptions of the recording session. When recording is completed, reconnect the data logger to your PC and download the recorded data using the Windows software. The Windows software allows you to view recorded data in text or graphical format. OM-PL models are available to record internal temperature and an external temperature channel (OM-PLT2); two external temperature channels (OM-PLTT); temperature, humidity and dew point (OM-PLTH); temperature and pressure (OM-PLPT); AC current and voltage (OM-PLCV); 4 to 20 mA (OM-PL420); and internal temperature and an external thermocouple input (OM-PLTC).
